Folsom Lake

Cyanobacteria blooms

Microcystis

- Colonial cyanobacterium (blue-green algae)
- Diameter 6 to 50,000 μm
- Cells contain microcystins that promote liver cancer
- Cell wall contains lipopolysaccharides

Delta

- Blooms began 1999 in Delta
- Peak biomass in August and September
- Vertically migrates daily to surface

distribution

California

San Pablo Bay

Suisun Bay

San Francisco Bay

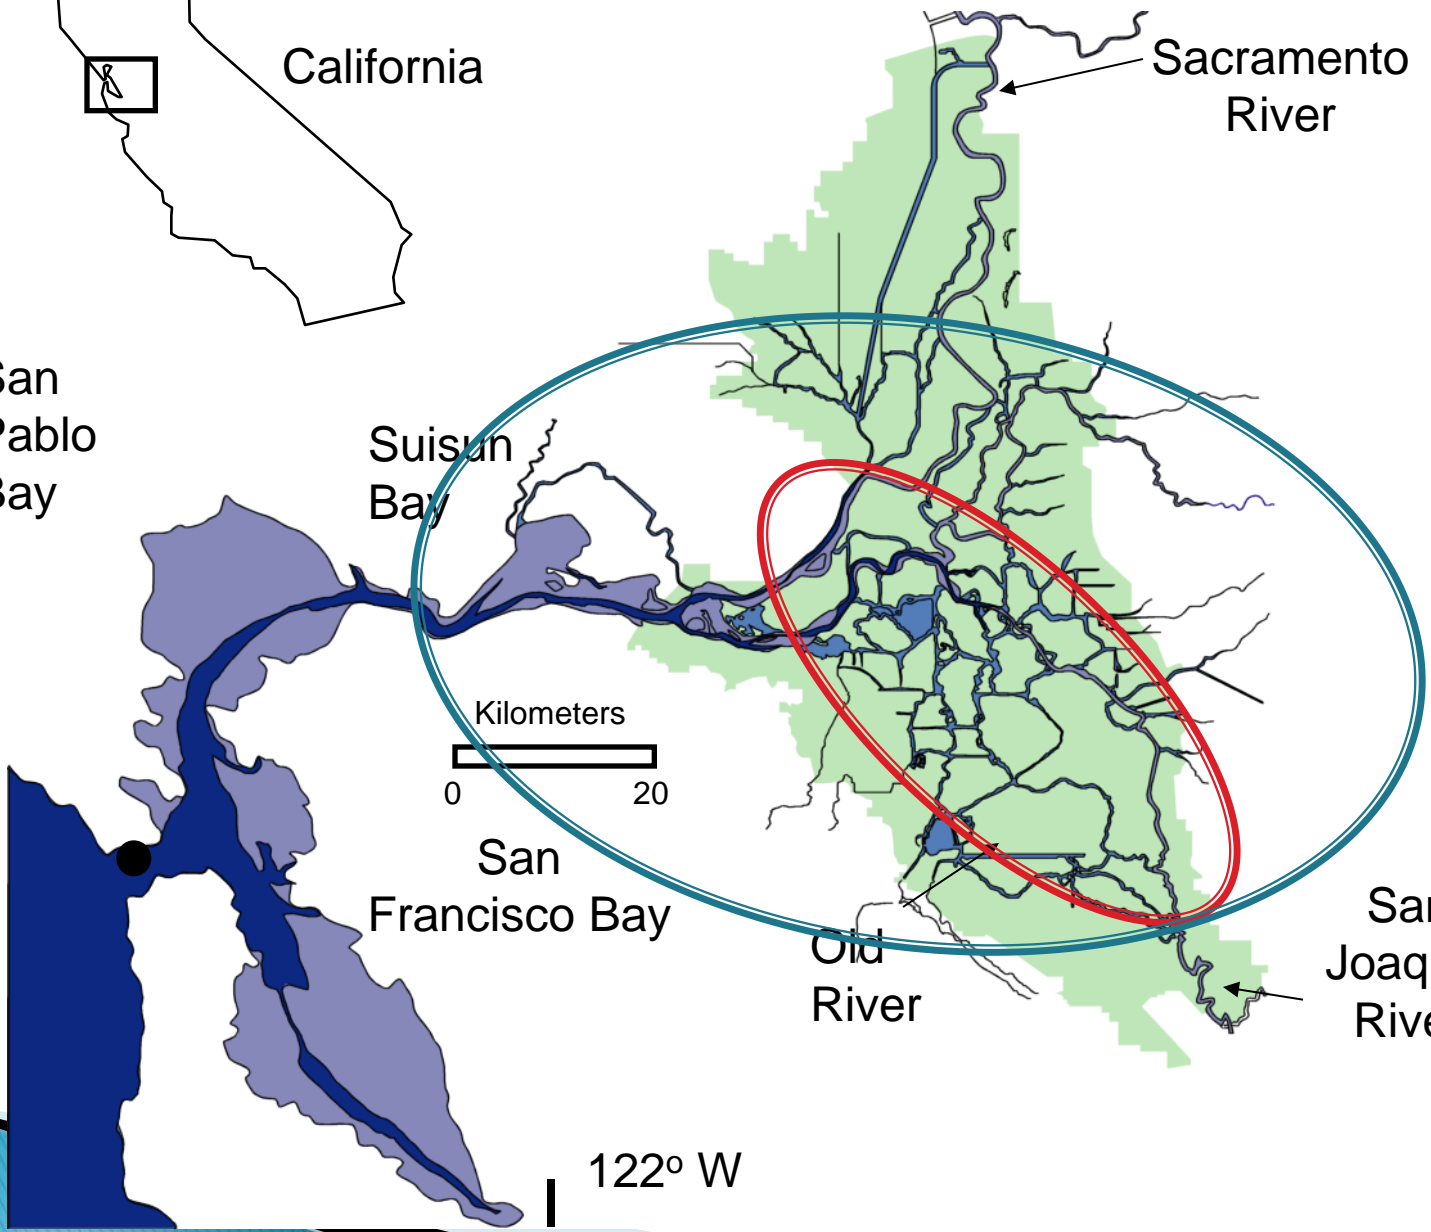

122° W

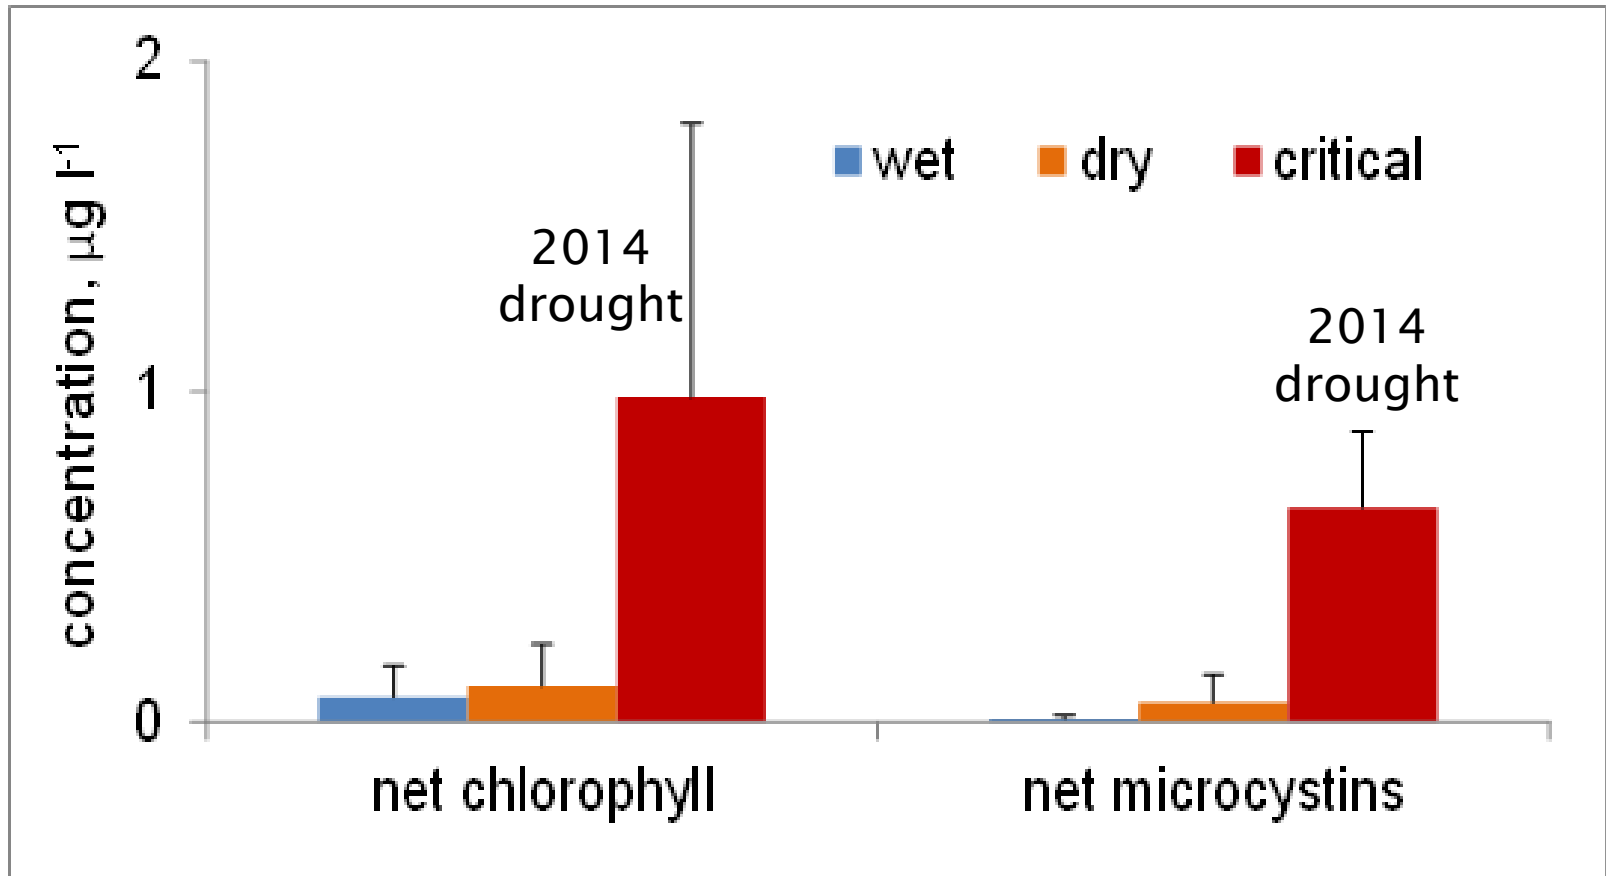

Sacramento River

Old River

San Joaquin River

Biomass & toxin concentration

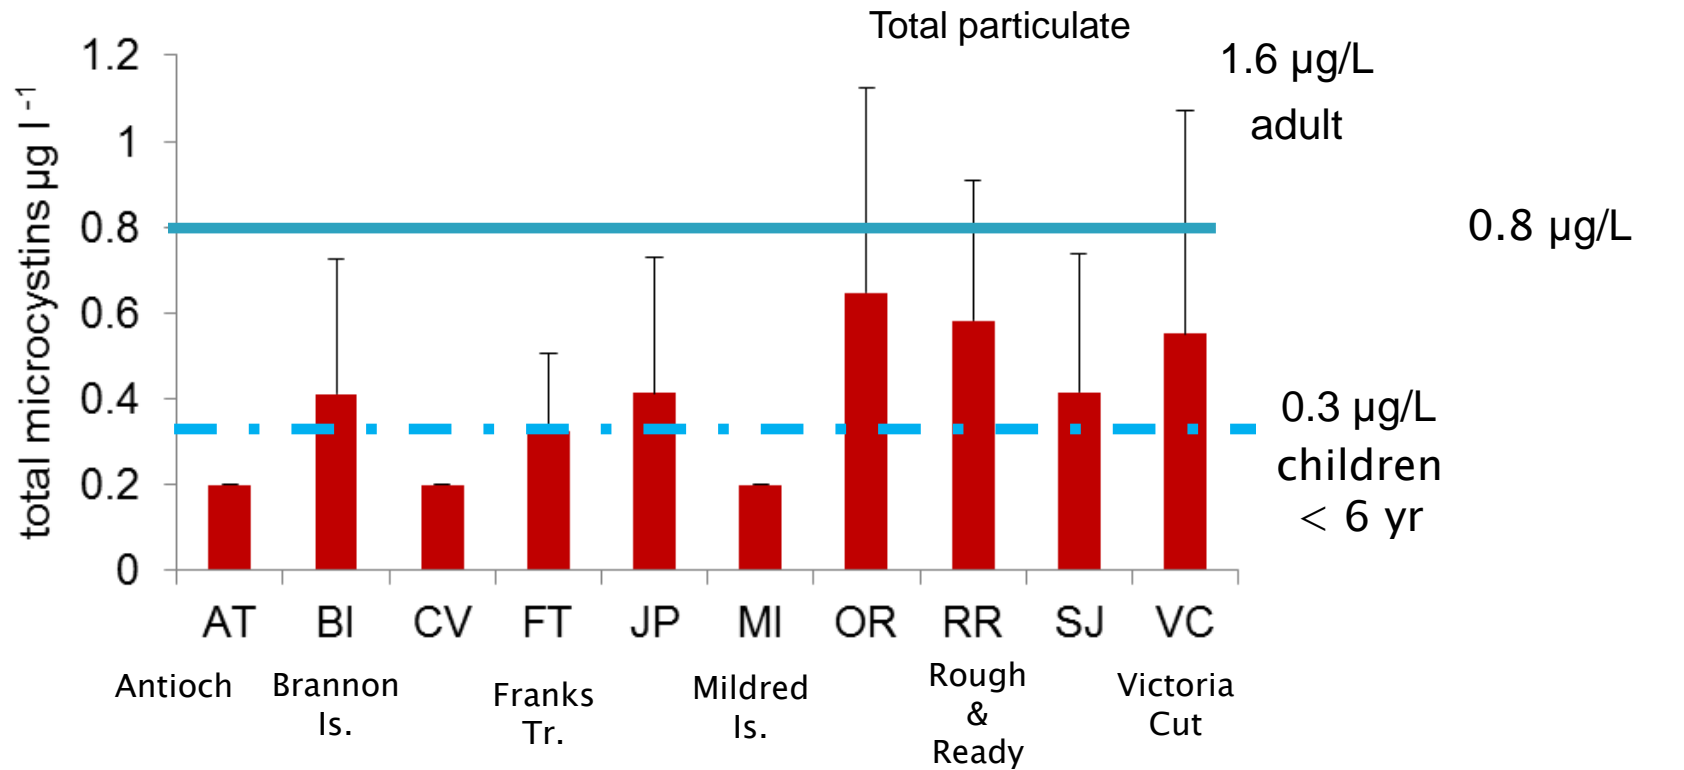

Wet: 2004–2005
Dry: 2007–2008

toxic bluegreen algae

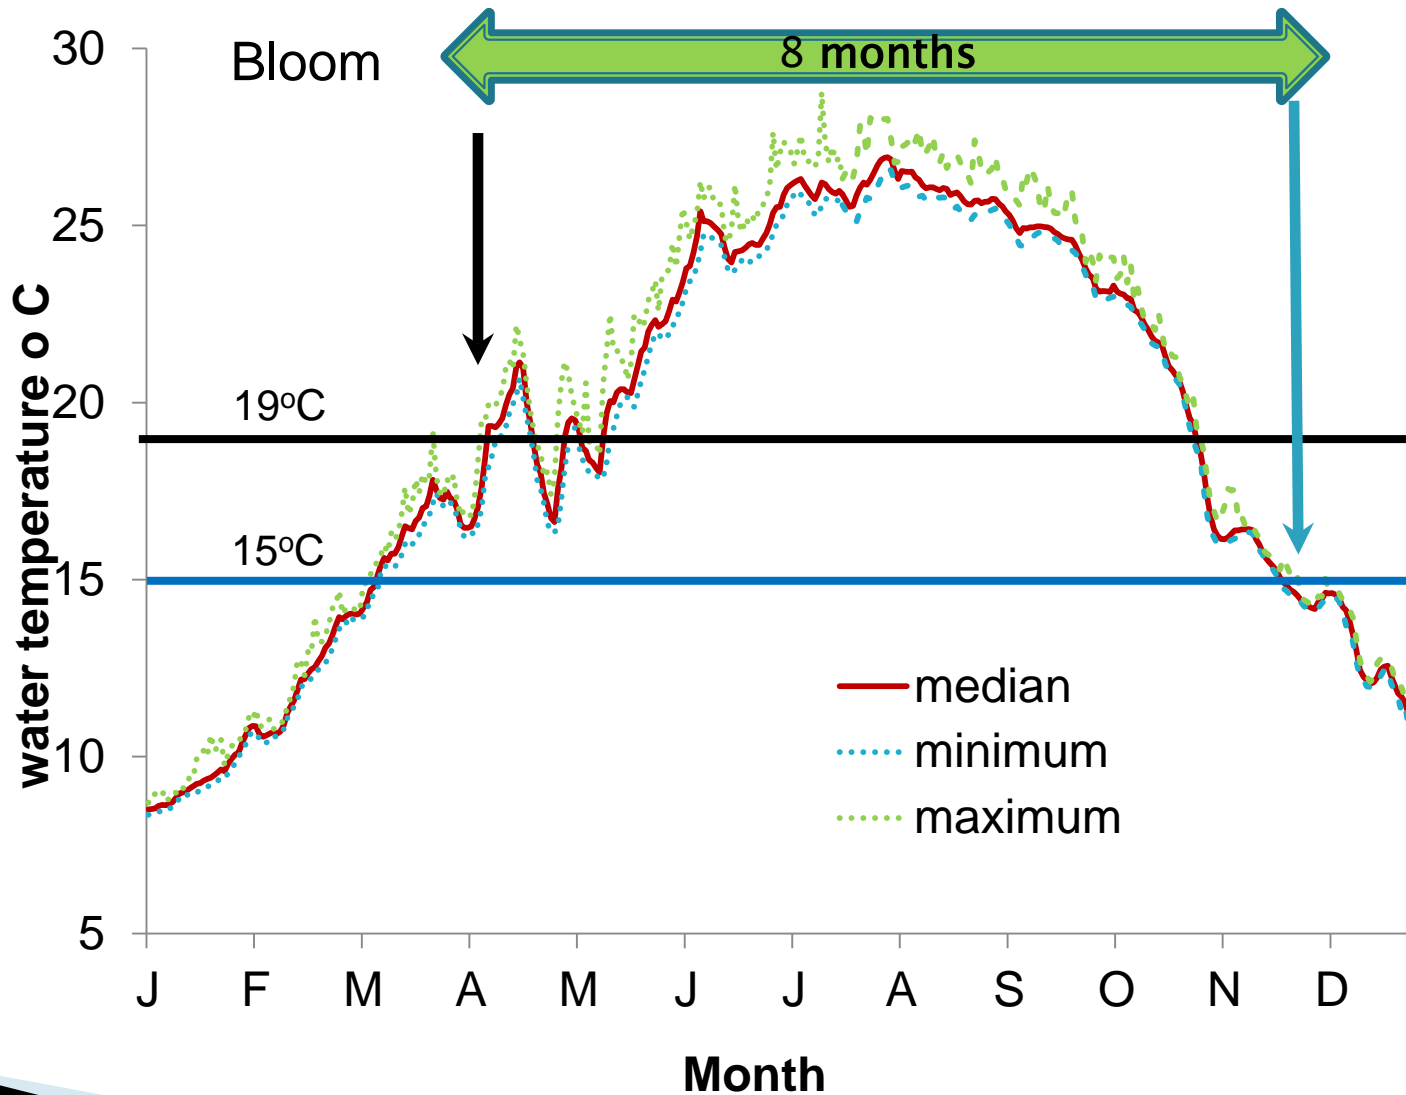

Environmental factors

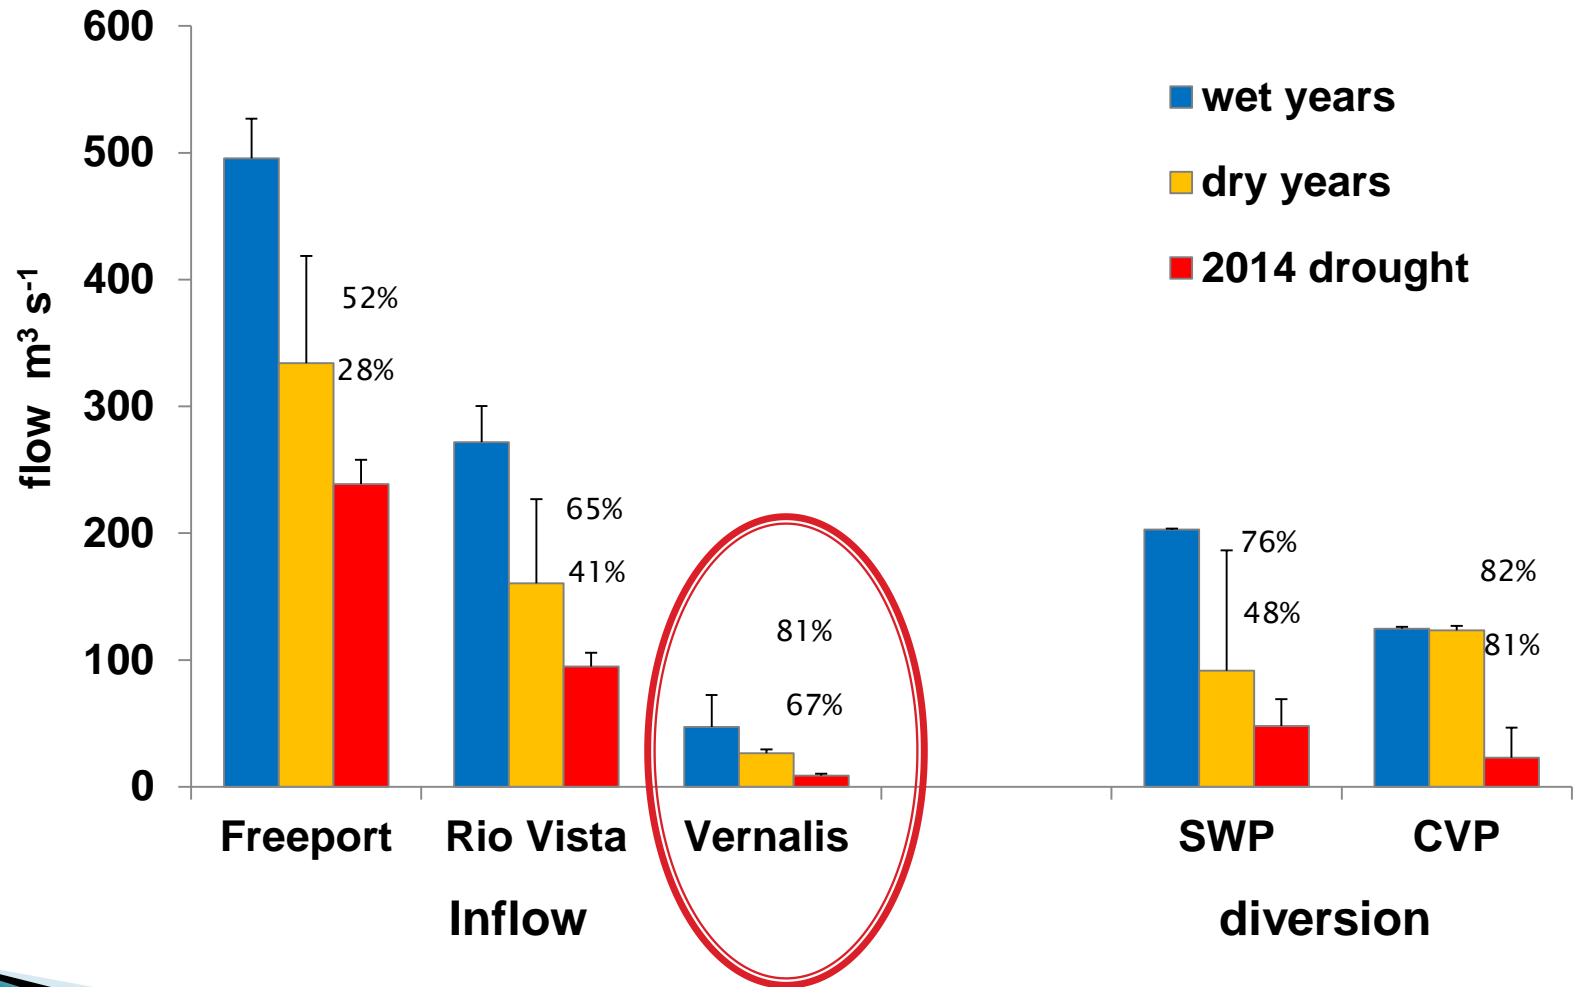

- ✓ • Warm water temperature $> 18^{\circ}\text{C}$
- ✓ • High residence time
- ✓ • High nutrient concentration, particularly ammonium
- ✓ • High light intensity
- ✓ • Low turbulence – stratification
